

Quantitative Methods

Multiple Regression

1. The General Multiple Linear Regression Model is:

$$Y_i = b_0 + b_1X_{1i} + b_2X_{2i} + \dots + b_kX_{ki} + \varepsilon_i$$

2. **Hypothesis Testing of Regression Coefficient:** -

$$t = \frac{b_j - b_i}{s_{b_j}} \quad (n - k - 1) \text{ degrees of freedom}$$

3. P-value: Smallest level of significance for which the null hypothesis can be rejected.

4. P Value > α ; H_0 accept (α = Significance level)

5. P Value < α ; H_0 rejected

6. **Confidence Interval:**

$$b_j \pm (t_c * s_{b_j})$$

7. $SSE = \sum (y_i - \hat{y})^2 = \sum \varepsilon_i^2$

$$\sigma_{\varepsilon}^2 = \sigma(y_i - \hat{y})$$

↑

$$SEE/SER = \sqrt{\frac{\sum (x - \bar{x})^2}{n-2}} = \sqrt{\frac{\sum (\varepsilon_i - \bar{\varepsilon}_i)^2}{n-2}}$$

If $\bar{\varepsilon}_i = 0$; then:

$$= \sqrt{\frac{\sum \varepsilon_i^2}{n-2}} = \sqrt{\frac{SSE}{n-2}} = \sqrt{MSE}$$

8. **Confidence Interval for A Regression Coefficient:**

$$\hat{b}_j \pm (t_c \times s_{b_j})$$

↓

standard error of b_i

use $(n-k-1)$ d_f

where K = no of independent variables

- $s_{b_i} = f_n [SEE]$

9. **Confidence interval for \hat{y} -> forecasted variables:**

$$Y = \hat{Y} \pm (t_c \times s_f)$$

↓

S.E of \hat{y}

$$TSS = SSE + ESS$$

$$SSR \quad RSS$$

$$\sum (y_i - \bar{y})^2 = \sum (y_i - \hat{y})^2 + \sum (\hat{y} - \bar{y})^2$$

↓

Can't explain

ESS / RSS = the difference that is explained by independent variable.

$$R^2 = \frac{ESS}{TSS} = \frac{TSS - SSR}{TSS} = 1 - \frac{SSE/SSR}{TSS}$$

↓

Always +ve

10. **Predicting the dependent variable:**

$$\hat{Y}_i = \hat{b}_0 + \hat{b}_1 \hat{X}_{1i} + \hat{b}_2 \hat{X}_{2i} + \dots + \hat{b}_k \hat{X}_{ki}$$

11. **The F - Statistics:**

$$F\text{-stat} = \frac{MSR}{MSE} \text{ (one - tailed test)}$$

(RSS/ESS)

Where MSR = mean regression sum of squares

MSE = mean squared error

(SSR/SSE)

12. **Coefficient of Determination:**

$$R^2 = \frac{RSS}{TSS} = \frac{ESS}{TSS} = \frac{TSS - SSE}{TSS}$$

13. **Adjusted R²:**

$$R_a^2 = 1 - \left[\left(\frac{n-1}{n-k-1} \right) \times (1 - R^2) \right]$$

Anova Table:

1. $R^2 = \frac{RSS}{TSS}$

 $F = \frac{MSR}{MSE}$ with k and n-k-1 degrees of freedom

 $MSR = \frac{RSS}{K} = \frac{RSS}{1}$; K = 1 for simple linear regression

$$MSE = \frac{SSE}{n-K-1} = \frac{SSE}{n-2}$$

If $K \geq 1$; $R^2 > R_a^2$ (No comparison of R^2 & R_a^2)

$$R_a^2 = 1 - \left[\left(\frac{n-1}{n-k-1} \right) (1 - R^2) \right]$$

Time-Series Analysis1. **Linear Trend Model:**

$$Y_t = b_0 + b_1(t) + \varepsilon_t$$

2. **Ordinary Least Squares (OLS) regression:**

$$\hat{Y}_i = \hat{b}_0 + \hat{b}_1(t)$$

3. **Log - Linear Trend Model:**

$$Y_t = e^{b_0 + b_1(t)}$$

4. **Autoregressive Model (AR):**

$$X_t = b_0 + b_1 X_{t-1} + \varepsilon_t$$

5. **AR (p) Model:**

$$X_t = b_0 + b_1 X_{t-1} + b_2 X_{t-2} + b_p X_{t-p} + \dots + \varepsilon_t$$

6. **Autocorrelation & Model Fit:**

$$t = \frac{\rho(e_t, e_{t-k})}{\frac{1}{\sqrt{T}}}$$

7. Random Walk with A Drift:
 $X_t = b_0 + b_1 X_{t-1} + \varepsilon_t$
8. Covariance Stationarity:
 $X_t = b_0 + b_1 X_{t-1} + \varepsilon_t$
9. Unit Root Testing for Non-Stationary:
 $X_t = b_0 + b_1 X_{t-1} + \varepsilon$
 $X_t - X_{t-1} = b_0 + b_1 X_{t-1} - X_{t-1} + \varepsilon$
10. First Differencing:
 $Y_t = X_t - X_{t-1} \Rightarrow Y_t = \varepsilon_t$
 $Y_t = b_0 + b_1 Y_{t-1} + \varepsilon_t$
11. ARCH (1) Regression Model:
 $\hat{\varepsilon}_t^2 = a_0 + a_1 \hat{\varepsilon}_{t-1}^2 + \mu_t$
12. Predicting the Variance of a Time Series:
 $\hat{\sigma}_{t+1}^2 = \hat{a}_0 + \hat{a}_1 \hat{\varepsilon}_t^2$

Problems:

	Hetero-skedasticity	Meaning σ_{ε_i} not constant Conditional Based on 'x' unconditional random	Effect b_I not affected F-test X $S_{bI} \times$ t-stat - inaccurate	Detection Scatter plot Breush pagan (BP) test $n \times R^2$	Correction Robust SE/ white corrected SE Generalized least squares
1	Serial correlation	Errors terms are correlated $\rho E_i, E_j \neq 0$	$S_{bI} \times \downarrow$; t stat \uparrow F-test x Type I error	Residual plot \rightarrow the $S_{bI} \downarrow$ Type I error \rightarrow -ve $S_{bI} \uparrow$ Type II Error $DW_{stat} = 2(I-r)$ H_a : positively correlated H_0 : not positively correlated	CH+ serial = Hansen Only serial = Hansen Improve specification of model
1	Multi collinearity	$r_{X_I, X_2} \neq 0$	$S_{bI} \uparrow \times$ b_I, b_2 unaffected \therefore Prob of type II Error \uparrow	If individual coefficients are insignificant but F-test, R^2 is significant then $X_I X_2$ correlation \uparrow Multi collinearity	<ul style="list-style-type: none"> • Omit correlation independent variable • Stepwise regression

Economics

Currency Exchange Rates: Understanding Equilibrium Value

1. Mark To Market Value =
$$\frac{(\text{Forward Price New} - \text{F.P locked old})(\text{Contract Size})}{[1+r(\frac{n}{360})]}$$

↓
Price currency
2. Covered Interest Rate Parity:

$$F_{A/B} = S_{A/B} \left(\frac{1+i_A}{1+i_B} \right)$$

$$F (\text{disc/premium}) = S_A + \left(\frac{(i_A - i_B) (\frac{n}{360}) \rightarrow \text{if LIBOR rates}}{(1+i_B) n/360} \right)$$
3. Uncovered Interest Rate Parity:

$$E (\% \Delta S)_{(A/B)} = R_A - R_B$$
4. International Fisher Relation:

$$R_{\text{nominal A}} - R_{\text{nominal A}} = + E (\text{Inflation}_A) - E (\text{Inflation}_B)$$
5. Purchasing Power Parity:

$$F = S \left(\frac{1+\text{Inflation}_A}{1+\text{Inflation}_B} \right)$$
6. Absolute PPP:

$$S (A/B) = \frac{\text{CPI (A)}}{\text{CPI (B)}}$$
7. Relative PPP:

$$\% \Delta S (A/B) = \text{Inf}_A - \text{Inf}_B$$
8. Real Exchange Rate =
$$S_t \times \frac{(1+r_B)^T}{(1+r_A)^T}$$
9. BOP \Rightarrow Current A/c + Capital A/c + Official Reserve A/c = 0
10. Real exchange rate A/B = (Equilibrium Real Exchange Rate A/B)
 (B affricates) $\uparrow + (\uparrow \text{Real Int. rate}_B - \text{Real Int. rate}_A)$
 $- (\text{Risk Premium}_B - \uparrow \text{Risk Premium}_A)$
11. Taylor's Rule: -

$$R = r_n + \pi + \alpha(\pi - \pi^*) + \beta(\gamma - \gamma^*)$$
12. Real Interest Rate =
$$r_n + \pi + \alpha(\pi - \pi^*) + \beta(\gamma - \gamma^*)$$

Economic Growth

1. $\Delta P = \Delta GDP + \Delta(E/GDP) + \Delta(P/E)$
2. Cobb - Douglas Function:

$$Y = TK^\alpha L^{(1-\alpha)}$$
3. Output Per Worker = $Y/L = T(K/L)^\alpha$
4. Marginal Product of Capital = $\frac{\Delta Y}{\Delta K} = \frac{\alpha Y}{K}$
 (Constant)
 Marginal Productivity = $\frac{\Delta Y/L}{\Delta K/L}$, $K \uparrow$ $L = \text{constant}$
 (Diminishing)
5. $MP K = r$ (Marginal cost of K) \rightarrow rental price of capital
 \downarrow
6. Growth Accounting Relation:

$$\Delta Y/Y = \Delta A/A + \alpha (\Delta K/K) + (1-\alpha) (\Delta L/L)$$
7. Growth in Potential GDP = i) Long Term Growth of Technology + α (Long Term Growth of K) + $(1-\alpha)$ (Long-Term Growth of L)
 ii) Long Term Growth of Labour Force + Long Term Growth in Labour Productivity (Output Per Worker) Both Capitals Depending + Technology Process.
8. Labour Force Participation = $\frac{\text{Labour Force}}{\text{Working Age Population}}$
 Where Labour Force = Employed + Unemployed Available to Work.
9. G^* (Growth of Output Per Capita) = $\frac{\theta}{1-\alpha}$
10. G^* (Growth of Output) = $\frac{\theta}{1-\alpha} + \Delta L$

Financial Statement Analysis

Intercorporate Investments

- Full Goodwill = (Fair Value of Equity of Whole Subsidiary) - (Fair Value of Net Identifiable Assets of The Subsidiary)
 - Allowed under both IFRS & USGAAP
- Partial goodwill = Purchase Price - (% owned X FV of Net Identifiable Assets)
 - Allowed under only IFRS
- Goodwill Impairment

<p>US GAAP</p> <p>1) CA > FV of reporting unit</p> <p>2) CA of g/w - implied FV of g/w</p> <p style="text-align: center;">↓</p> <p>FV of unit - net identifiable asset</p> <p>Years to Repay Debt from CFO = $\frac{\text{Total Debt}}{\text{Operating CF} - \text{Reinvestment}}$</p>	<p>IFRS</p> <p>1) CA > RA => loss in P/L</p>
--	--

Employee Compensation: Post-Employment and Share-Based

- Pension

<p>Plan Asset Plan Assets</p> <ul style="list-style-type: none"> FV at beginning of year + Contributions + Actual Return <u>- Benefits paid</u> = FV at end of year 	<p>PBO at beginning of year</p> <ul style="list-style-type: none"> (+) Current service cost (+) Interest cost (+) PSC (+) Actual Loss/ (-) gain <u>(-) Benefits</u> = PBO at end of year
--	--
- Plan Asset > PBO - Overfunded Plan
- Plan Asset < PBO - Underfunded Plan
- Funded Status = Fair Value of Plan Asset - PBO
- TPPC = Employer contributions - [Ending Funded status - Beginning Funded status]
 - = Employer contribution - [(End Plan Asset - End PBO) - (Beginning plan Asset - Beginning PBO)]
 - = Employer contribution - [(Ending Plan Asset - Beginning Plan Asset) - (Ending PBO - Beginning PBO)]
 - = ~~Cont~~ - [(~~cont~~ + Actual Return - ~~Benefit~~) - (Current SC + Int cost + PSC ± Actuarial gain/ loss - ~~Benefit~~)]
 - TPPC = Current SC + Int cost + Past SC ± Actuarial gain / loss - Actual Return

US GAAP

- Current Service cost in P/L
 - Interest cost in P/L
 - Expected Return in P/L
 - PSC in OCI (amortized over remaining life)
 - Actuarial g/l in OCI (expected return - actual return)
- Corridor approach ↓
- Amortize amount that is above 10% x max (A, L) over the remaining life

IFRS

- Current Service cost in P/L
 - Net Interest income in P/L
 - income if overfunded (A > L)
 - expense if underfunded (A < L)
 - PSC in P/L (recognized immediately)
 - Actuarial g/l in OCI (expected return - actual return)
- Not amortized over

6. Expected Return = Expected rate \times Beginning plan Asset
7. Net Int cost/ income = Disc. Rate \times Beginning funded status (A-L)
8. For IFRS, disc rate & expected return is same
9. Periodic pension cost in OCI = TPPC - periodic pension cost in P/L
Or
Actuarial Gains/ losses $+(Actual - expected)$ return
10. To reclassify:
 - Op. income + Full pension exp - current SC
 - Add int cost to int exp.
 - Add Actual return to other (non -operating) income.
11. $Cont^n > TPPC \rightarrow$ reduction in PBO
 $Cont^n < TPPC \Rightarrow$ source of borrowing
 From CFO $\rightarrow (+)$
 CFF $\rightarrow (-)$

Evaluating Quality of Financial Reports

1. The Beneish Model (M-score):
 - i. DSRI: $\frac{Days\ Rec_t}{Days\ Rec_{t-1}} \uparrow X$
 - ii. GMI: $\frac{Gross\ Margin_{t-1}}{Gross\ Margin_t} \uparrow X$
 - iii. AQI: $\frac{Noncurrent\ asset\ except\ PP\ \&ET_t / Total\ Assets_t}{NCA\ except\ PP\ \&ET_{t-1} / Total\ Assets_{t-1}} \uparrow X$
 - iv. SGI: $\frac{Sales_t}{Sales_{t-1}} \uparrow X$
 - v. DEP: $\frac{Depreciation_{t-1}}{Depreciation_t} \uparrow X$
 - vi. SGAI: $\frac{\%SGA/sales_t}{\%SGA/sales_{t-1}} \uparrow X$
 - vii. Accruals: $\frac{Income\ Before\ EOI-CFO}{Assets} \uparrow X$
 - viii. Leverage Index: $\frac{D/A_t}{D/A_{t-1}}$ (*higher the better↓) X
2. Gauging Earning Persistence:

$$Earnings_{(t+1)} = \alpha + \beta_1 earnings_t + \varepsilon$$

$$Earnings_{(t+1)} = \alpha + \beta_1 cash\ flow_t + \beta_2 accruals_t + \varepsilon$$

Integration of Financial Statement Analysis Techniques

1. Sources of Earnings and ROE:

DuPont Decomposition -

$ROE = NI/EBT \times EBT/EBIT \times EBIT/Revenue \times Revenue/Average Asset \times Average Asset/Average Equity$

2. Accruals BS = NOA End - NOA Bgn

$$3. \text{ Accruals Ratio BS} = \frac{\text{Accruals}^{BS}}{(\text{NOA}_{\text{End}} + \text{NOA}_{\text{Beg}})/2}$$

4. Accruals CF = NI - CFO - CFI

$$5. \text{ Accruals ratio CF} = \frac{\text{Accruals}^{CF}}{(\text{NOA}_{\text{End}} + \text{NOA}_{\text{Beg}})/2}$$

6. CGO = EBIT + non-cash changes - increase in WC

	<u>IFRS</u>	<u>USGAAP</u>
Int paid	CFO/ CFF	CFO
Div. Paid	CFO/ CFF	CFF
Int/Div Recd.	CFO/CFI	CFO

- Market Value decomposition

Implied value = Parent's MV - Parents Pro- rate share in associate's MV

Financial Statement Modeling

1. Cost of Goods Sold (COGS):

Forecast COGS = (Historical COGS/revenue) x (Estimate of Future Revenue)

2. Financing Cost:

Net debt = Gross debt - Cash, cash equivalents & short-term investment.

Net interest expense = Gross Interest Expense - Interest Income (on cash & short-term debt securities)

3. Gross (net) interest expense rate = gross (net) expense/ gross (net) debt

4. Yield on average cash = interest income / cash + ST securities.

$$5. \text{ Effective tax rate} = \frac{\text{Income tax expense}}{\text{PBT}}$$

$$\text{Cash tax rate} = \frac{\text{Cash taxes paid}}{\text{PBT}}$$

6. Projected Accounts Receivables = Days Sales Outstanding x $\left(\frac{\text{Forecasted Sales}}{365}\right)$

$$7. \text{ ROC} = \frac{\text{Net Operating Profit}}{\text{D+E}} \rightarrow \text{Not adjusted for taxes}$$

$$\text{ROIC} = \frac{\text{NOPLAT}}{\text{D+E}} \rightarrow \text{Net operating profit - taxes}$$

$$\text{ROE} = \frac{\text{NI}}{\text{E}} \rightarrow \text{Not suitable for comparing companies with different capital structures}$$

8. Cannibalization rate = $\frac{\text{new product sales that replace existing product sales}}{\text{total new product sales}}$

Corporate Issuers

Analysis of Dividends and Share Repurchases

1. **Effective tax rate** = corporate tax rate + (1 - corporate tax rate) (individual tax rate)
2. **Expected increase in dividends** = [(expected earnings × target payout ratio) - previous dividend] adjustment factor
3. **FCFE coverage ratio** = FCFE / (dividends + share repurchases)
4. **Grinold-Kroner model**: $ERP = [DY + \Delta P/E + i + G - \Delta S] - r_f$
5. **Cost of equity based on DDM**: Cost of equity (r_e) = dividend yield (DY) + capital gains yield (CGY)
6. **Fama-French model**: *Required return of stock* = $r_f + \beta_1 ERP + \beta_2 SMB + \beta_3 HML$
7. **Five-factor Fama-French extended model**: *Required return of stock* = $r_f + \beta_1 ERP + \beta_2 SMB + \beta_3 HML + \beta_4 RMW + \beta_5 CMA$
8. **Expanded CAPM for private companies**: *Required return* = $r_f + \beta_{peer} \times ERP + SP + IP + SCRP$
9. **Build-up approach**: *Required return* = $r_f + ERP + SP + SCRP$
10. **Premium Paid Analysis**: $Premium = (DP - UP) / UP$

$$= (\text{deal price} - \text{unaffected price}) / \text{unaffected price}$$
11. **Gross profit margin** = $\frac{\text{gross profit}}{\text{net sales}}$
12. **Operating profit margin** = $\frac{\text{operating profit}}{\text{net sales}} = \frac{EBIT}{\text{net sales}}$
13. **Net profit margin** = $\frac{\text{net income}}{\text{net sales}}$
14. **Return on assets** = $\frac{\text{net income}}{\text{average total assets}}$
15. **Return on total capital** = $\frac{EBIT}{(\text{interest bearing debt} + \text{shareholders' equity})}$
16. **Return on total equity** = $\frac{\text{net income}}{\text{average total equity}}$
17. **Financial leverage ratio** = $\frac{\text{total assets}}{\text{total equity}}$
18. **Long-term debt-to-equity ratio** = $\frac{\text{total long-term debt}}{\text{total equity}}$
19. **Debt-to-equity ratio** = $\frac{\text{total debt}}{\text{total equity}}$

Equity

Equity Valuation: Application & Processes

1. $IV_{\text{analyst}} - \text{price} = (IV_{\text{actual}} - \text{price}) + (IV_{\text{analyst}} - IV_{\text{actual}})$
2. Conglomerate Discount = Sum of individual parts - Sum as a whole.

Discounted Dividend Valuation

DDM Model:

1. One Period -

$$P_0 = \frac{D_1 + P_1}{1 + R_e}$$

2. Two period -

$$P_0 = \frac{D_1}{1 + R_e} + \frac{D_2 + P_2}{(1 + R_e)^2}$$

3. Multi period -

$$P_0 = \frac{D_1}{1 + R_e} + \frac{D_2}{(1 + R_e)^2} + \dots + \frac{D_n + P_n}{(1 + R_e)^n}$$

4. Gordon Growth Model:

$$P_0 = \frac{D_1}{R_e - g}$$

5. Present value of growth opportunities (PVGO):

$$P_0 = \frac{E_1}{R_e} + PVGO$$

6. Justified trailing P/E:

$$\frac{P_0}{E_0} = \frac{(1+g)(1-b)}{R_e - g}$$

Justified leading P/E:

$$\frac{P_0}{E_1} = \frac{(1-b)}{R_e - g}$$

7. Value of perpetual preferred shares = $\frac{D_p}{r_p}$

8. Valuation using H - Model

$$V_0 = \frac{D_0(1+g_L)}{R_e - g_L} + \frac{D_0 \times t/2 \times (g_S - g_L)}{R_e - g_L}$$

9. Sustainable growth rate:

$$SGR (g) = b \times ROE$$

$$\text{Where, } ROE = \frac{NI}{\text{Stockholders' Equity}} = \frac{NP(NI)}{\text{sales}} \times \frac{\text{Sales}}{\text{Total Assets}} \times \frac{\text{Total Assets}}{\text{Stockholders' Equity}}$$

$$\therefore g = \left(\frac{\text{Net Income} - \text{Dividends}}{\text{Net Income}} \right) \times \frac{\text{Net Income}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Total Asset}} \times \frac{\text{Total Assets}}{\text{Stockholders' Equity}}$$

10. Intrinsic value > market value → undervalued
11. Intrinsic value = market value → fairly valued
12. Intrinsic value < market value → overvalued

Free Cash Flow Valuation

1. FCFF - 4 Approaches:

- i. $FCFF = NI + NCC + \text{Interest} (1 - \text{TAX}) - \text{fC Investment} - \text{WC Investment}$
- ii. $FCFF = NI + NCC - \text{WC Investment} + \text{Interest} (1 - \text{TAX}) - \text{fC investment}$
 $= \text{CFO} + \text{Interest} (1 - \text{TAX}) - \text{FC Investment}$
- iii. $FCFF = \text{EBIT} (1 - \text{TAX}) + \text{Depreciation} - \text{fC investment} - \text{WC investment}$
- iv. $FCFF = \text{EBITDA} (1 - \text{TAX}) + (\text{Depreciation} \times \text{TAX}) - \text{fC investment} - \text{WC investment}$

2. FCFE - 4 Approaches:

$$FCFE = FCFF - \text{Interest} (1 - \text{TAX}) + \text{NET Borrowings}$$

$$FCFE = NI + NCC - \text{WC Investment} - \text{FC Investment} + \text{Net Borrowings}$$

$$FCFE = \text{CFO} - \text{FC Investment} + \text{Net Borrowings}$$

$$FCFE = NI - (1 - \text{DR}) [(\text{FC Investment} - \text{Depreciation}) + \text{WC Investment}]$$

$$\therefore 1 - \text{DR} = 1 - \frac{D}{A} = \frac{A - D}{A} = \frac{E}{A}$$

3. Single Stage FCFF / FCFE Model:

$$\text{FCFF: Value of Firm} = \frac{FCFF_1}{\text{WACC} - g} = \frac{FCFF_0 \times (1 + g)}{\text{WACC} - g}$$

$$\text{FCFE: Value of Equity} = \frac{FCFE_1}{r - g} = \frac{FCFE_0 \times (1 + g)}{r - g}$$

4. Terminal Value in year n = (trailing P/E) × (earnings in years n)
5. Terminal Value in year n = (leading P/E) × (forecasted earnings in year n + 1) = $\frac{P}{E_1} \times E_0(1 + g)$

Market-Based Valuation: Price and Enterprise Value Multiples

1. Trailing P/E = $\frac{\text{Market price per share}}{\text{EPS over previous 12 months}}$
2. Leading P/E = $\frac{\text{Market price per share}}{\text{Forecasted EPS over next 12 months}}$
3. P/B Ratio = $\frac{\text{Market price of Equity}}{\text{Book value of Equity}}$
4. P/S Ratio = $\frac{\text{Market value of Equity}}{\text{Total Sales}}$
5. Dividend Yield: D/P
6. Trailing D/P = D_0/P_0
7. Leading D/P = D_1/P_0
8. Justified P/E Multiple:

$$P_0 = \frac{D_1}{R_e - g}$$
 Justified trailing P/E = $\frac{P_0}{E_0} = \frac{(1-b)(1+g)}{r-g}$
 Leading P/E = $\frac{P_0}{E_1} = \frac{1-b}{r-g}$
9. Justified P/B Multiple:
 Justified P/B Ratio = $\frac{\text{ROE}-g}{r-g}$
10. Justified P/S Multiple:
 Justified $\frac{P_0}{S_0} = \frac{\left(\frac{E_0}{S_0}\right) \times (1-b)(1+g)}{r-g}$
11. Justified P/CF Multiple:

$$V_0 = \frac{\text{FCFE}_0(1+g)}{r-g}$$
12. Justified Dividend Yield:

$$\frac{D_0}{P_0} = \frac{r-g}{1+g}$$

13. FED & YARDENI Model:
 Fed model:
 $(E/P)_{S\&P} > (E/P)_{10 \text{ yr T-Bond}} \therefore \text{undervalued}$
 $(E/P)_{S\&P} < (E/P)_{10 \text{ yr T-Bond}} \therefore \text{overvalued}$
 Yardeni model:
 Earnings yield of market (E/P) = yield on 'A' rated bond - k x (Long term growth rate)
14. PEG RATIO:

$$\text{Peg ratio} = \frac{\text{P/E ratio}}{g}$$
 CF = Net Income + depreciation + amortization
 FCFE = CFO - FC Inv + Net borrowing

$$\text{P/CF} = \frac{\text{MV of equity}}{\text{CF}} = \frac{\text{Market price per share}}{\text{CF Per Share}}$$

$$\text{EV/EBITDA ratio} = \frac{\text{enterprise value}}{\text{EBITDA}}$$
15. Momentum indicator:
 - i. Earnings Surprise = Reported EPS - Expected EPS
 - ii. Standardized Unexpected Earnings (SUE) = $\frac{\text{earnings surprise}}{\text{SD of earnings surprise}}$
16. Weighted Harmonic Mean = $\frac{1}{\sum_{i=1}^n \frac{w_i}{X_i}}$

Residual Income Valuation

1. $RI = \text{Net Income} - \text{Cost of Equity} \times \text{Equity Capital (equity charge)}$
 $= (ROE - r) BV_{\text{equity}(t-I)}$ where $BV = \text{beginning BV}$
2. $EVA = \text{NOPAT} - (\text{WACC} \times \text{TOTAL CAPITAL}) \rightarrow \text{Beginning invested capital (D + E)}$
 $= [\text{EBIT} - (1-\text{tax})] - \text{WACC}$
3. $MVA = \text{Market Value} - \text{Total Capital}$
4. $RI_t = E_t - (r \times B_{t-1}) = (ROE - r) \times B_{t-1}$
5. Intrinsic Value:

$$P_0 = B_0 + \left\{ \frac{RI_1}{(1+r)^1} + \frac{RI_2}{(1+r)^2} + \frac{RI_3}{(1+r)^3} + \dots \right\}$$
6. Single - stage Residual Model:

$$P_0 = B_0 + \left[\frac{(ROE-r) \times B_0}{r-g} \right]$$
7. The growth rate implied by the market price in a single - stage residual income:

$$g = r - \left[\frac{B_0 \times (ROE-r)}{P_0 - B_0} \right]$$
8. Tobin's Q = $\frac{\text{market value of debt} + \text{market value of equity}}{\text{replacement cost of total asset}}$
9. $P_0 = B_0 + (\text{PV of interim high-growth RI}) + (\text{PV of continuing residual income})$
10. $\text{PV of Continuing Residual Income in year } T - 1 = \frac{RI_T}{1+r-\omega}$

Private Company Valuation

1. $V_F = \frac{FCFF_1}{\text{WACC}-g}$
2. $V_E = \frac{FCFE_1}{K_e-g}$
3. Control premium = pro rata value of controlling interest - pro-rata value of non-controlling interest.
4. Adjusted control premium (applicable for MVIC multiple) = (control premium on equity) \times (1 - DR) [DR = Debt to asset ratio]
5. $DLOC = 1 - [1 / (1 + \text{control premium})]$
6. Total discount for lack of marketability = $1 - [(1 - DLOC) (1 - DLOM)]$

Fixed Income

The Term Structure & Interest Rate Dynamics

1. The Relationship Between the Discount Factor P_T and the Spot Rate S_T :

$$P_T = \frac{1}{(1+S_T)^T}$$

2. Forward Rates:

$$F_{(j,k)} = \frac{1}{[1+f(j,k)]^k}$$

3. The Forward Pricing Model:

$$F_{(j,k)} = \frac{P_{(j+k)}}{P_j}$$

4. The Forward Rate Model:

$$[1 + S_{(j+k)}]^{(j+k)} = (1 + S_j)^j [1 + f(j, k)]^k$$

5. Swap Rate = $\frac{1-d_L}{\sum d_L}$

6. Swap Spread_t = Swap Rates_t - Treasury yield_t (Same Maturity)

7. I spread = Riskiness of Corporate Bond Over Banks

↓

compⁿ credit liquidity risk = corp Bond - swap rate

8. TED Spread = (3months LIBOR Rate) - (3months T-bill Rate)

9. LIBOR - O/S Spread = ↑ = banks unwilling to lend; ↓ = liquidity

↓

Includes credit risk minimal credit risk measure of money market securities risk

10. Cox - Ingersoll Ross Model (CIR):

$$dr = [a(b-r) dt + (\sigma\sqrt{r}. dz)]$$

11. Vasicek Model:

$$dr = [(a(b-r) dt + (\sigma dz)]$$

12. Ho-Lee Model:

$$dr_t = \theta_t dt + \sigma dz_t$$

13. Sensitivity to Parallel, Steepness, and Curvature Movements:

$$\frac{\Delta P}{P} = D_L \Delta x_L - D_S \Delta x_S - D_C \Delta x_C$$

Valuation and Analysis Bonds with Embedded Options

1. Value of option embedded in a bond:
 $V_{\text{Call}} = V_{\text{straight bond}} - V_{\text{callable bond}}$
 $V_{\text{Put}} = V_{\text{puttable bond}} - V_{\text{straight bond}}$
2. $OAS = Z - \text{Call Risk}$
3. $OAS = Z + \text{Put Risk}$
4. Effective Duration = $\frac{P_2 - P_1}{2P_0 \Delta y}$
5. Effective Convexity = $\frac{P_2 + P_1 - 2P_0}{P_0 (\Delta y)^2}$
6. Market Conversion Premium Ratio = $\frac{\text{Conversion Premium} \times \text{Market Per Share}}{\text{Market Price of Convertible Stock}}$
7. Conversion Value = Market Price of Stock \times Conversion Ratio.
8. Market Conversion Price = $\frac{\text{Market Price of Convertible bond}}{\text{Conversion Ratio}}$
9. Market Conversion Premium Per Share = Market Conversion Price - Stock's Market Price.
10. Premium Over Straight Value = $\frac{\text{Market Price of Convertible Bond}}{\text{Straight Value}} - 1$
11. Put - Call Parity:
 $C - P = PV(\text{Forward price of the bond on exercise date}) - PV(\text{Exercise price})$

Credit Analysis Models

1. Present Value of Expected Losses = Expected Loss + Risk Premium - Time Value Discount
2. Value of Stock_T = Max (0, A_T - K)
3. Value of Debt_T = Min (A_T, K)
4. Probability of Default = I - N (e₂)

$$e_1 = \frac{\ln\left(\frac{A_t}{K}\right) + \mu(T-t) + \frac{1}{2}\sigma^2(T-t)}{\sigma\sqrt{T-t}}$$
 Where μ = Annual rate of return on company's assets.

$$e_2 = e_1 - \sigma\sqrt{T-t}$$
5. Key rate duration total duration → same effect if parallel shift
6. Duration exposure = Add the duration
7. Effective Duration = $\frac{P_2 - P_1}{2P_0 \Delta y}$
8. Effective Convexity = $\frac{P_2 - P_1}{P_0 (\Delta y)^2}$
9. % Δ Bond Price = $-\Delta y \times ED = \frac{1}{2} \times EC \times (\Delta y)^2$
10. VCB = VNCB - Call Price
11. VPB = VN_{PB} + Put Price

Credit Default Swaps

1. Pay-out Amount = pay-out Ratio \times NP
2. Pay-out Ratio = $1 - (\text{Recovery Rate})\%$
3. Hazard rate/ conditional Prob. Of default = Prob. (PD/ Default has not occurred)
4. Expected Loss = Hazard Rate \times LGD (% terms)
5. Upfront payment = PV (protection leg) - PV (premium leg)

\downarrow
Based on CDS spread

\downarrow
Based on coupon rate
6. Upfront Premium = (CDS spread - CDS coupon) \times duration of spread
7. Price of CDS = $100 - \text{Upfront Premium} (\%)$
8. Valuation After Inception of CDS:
 Profit for protection buyer $\approx (\Delta\text{spread} \times \text{duration}) \times \text{Notional Principal Or,}$
 Profit for protection buyer (%) $\approx \text{change in spread} (\%) \times \text{duration}$

Derivatives

Pricing and Valuation of Forward Commitments

1. Forward Price = Price That Prevents Profitable Riskless Arbitrage in Frictionless Markets

2. The Forward Contract Price:

$$FP = S_0 \times (1+R_f)^T$$

3. Forward Contracts with Discrete Dividends:

$$FP \text{ (on An Equity Security)} = (S_0 - PVD) \times (1+R_f)^T$$

$$FP \text{ (on an Equity Security)} = [S_0 \times (1 + R_f)^T] - FVD$$

4. Value of the Long Position in A Forward Contract on A Dividend Paying Stock:

$$V_t \text{ (long position)} = (S_t - PVD_t) - \left[\frac{FP}{(1+R_f)^{T-t}} \right]$$

5. Equity Forward Contracts with A Continuous Dividends:

$$FP \text{ (on An Equity Index)} = S_0 \times e^{(R_f^c - \delta^c) \times T} = (S_0 \times e^{\delta^c \times T}) \times e^{R_f^c \times T}$$

$$F = \frac{\text{Spot} \times e^{\text{interest} \times t}}{e^{\text{Dividends} \times t}}$$

6. Forward Price on A Coupon Paying Bond:

$$FP \text{ (on A Fixed Income Security)} = (S_0 - PVC) \times (1+R_f)^T = S_0 (1+R_f)^T - FVC$$

7. $V_t \text{ (Long Position)} = (S_t - PVC_t) - \left[\frac{FP}{(1+R_f)^{T-t}} \right]$

$$\text{Accrued Interest} = \frac{\text{Days Since Last Coupon}}{\text{Days Between Coupon Payment}} \times \text{Coupon Amount}$$

8. $FP = \left[(\text{Full price})(1 + R_f)^T - AI_T - FVC \right]$

9. $QFP = FP/CF = \left[(\text{Full Price})(1 + R_f)^T - AI_T - FVC \right] \left(\frac{1}{CF} \right)$

10. Covered Interest Rate Parity:

$$FT \text{ (Currency Forward Contract)} = S_0 \times \frac{(1+R_{PC})^T}{(1+R_{BC})^T}$$

11. Valuing Currency Forward Contracts After Initiation:

$$V_t = \frac{[FP_t - FP] \times (\text{contract size})}{(1+R_{PC})^{(T-t)}} = \left[\frac{S_t}{(1+R_{BC})^{T-t}} \right] - \left[\frac{F_T}{(1+R_{PC})^{T-t}} \right]$$

12. Value of Futures Contract = Current Futures Price - Previous Mark to Market Price.

13. Discount factors (zs):

$$Z = \frac{1}{\left[1 + \left(\text{LIBOR} \times \frac{\text{days}}{360} \right) \right]}$$

14. $SFR \text{ (Periodic)} = \frac{1 - \text{last discount factor}}{\text{sum of discount factors}}$

15. Market Value of An Interest Rate Swap:

$$\text{Value to The Payer} = \sum Z \times (SFR_{New} - SFR_{Old}) \times \frac{\text{days}}{360} \times \text{Notional Principal}$$

16. Equity Swaps:

$$SFR \text{ (Periodic)} = \frac{1 - \text{Last Discount Factor}}{\text{Sum of Discount Factors}}$$

Valuation of Contingent Claims

1. Put - Call Parity:

$$C_0 + \frac{X}{(1+R_F)^T} = P_0 + S_D$$

$$H = \frac{C^+ - C^-}{S^+ - S^-}$$

2. Black - Scholes Model:

$$C_0 = S_0 N(d_1) - e^{-rt} X N(d_2)$$

$$P_0 = e^{rt} X N(-d_2) - S_0 N(-d_1)$$

Where:

$$d_1 = \frac{\ln\left(\frac{S}{X}\right) + \left(r + \frac{\sigma^2}{2}\right) T}{\sigma \sqrt{T}}$$

$$d_2 = d_1 - \sigma \sqrt{T}$$

3. Options on Dividend Paying Stocks:

$$C_0 = S_0 e^{-\delta T} N(d_1) - e^{-rt} N(d_2)$$

$$P_0 = e^{-rt} N(-d_2) - S_0 e^{-\delta T} N(-d_1)$$

Where δ = Continuously Compounded Dividend Yield

$$d_1 = \frac{\ln\left(\frac{S}{X}\right) + \left(r - \delta + \frac{\sigma^2}{2}\right) T}{\sigma \sqrt{T}}$$

$$d_2 = d_1 - \sigma \sqrt{T}$$

4. Options on Currencies:

$$C_0 = S_0 e^{-r_B T} N(d_1) - e^{-r_P T} N(d_2)$$

$$P_0 = e^{-r_P T} N(-d_2) - S_0 e^{-r_B T} N(-d_1)$$

5. The Black Model: -

$$C_0 = \frac{F_T}{e^{rt}} N(d_1) - \frac{X}{e^{rt}} N(d_2)$$

$$\text{Where, } d_1 = \frac{\ln\left(\frac{F_T}{X}\right) + \left(\frac{\sigma^2}{2}\right) t}{\sigma \sqrt{t}}$$

$$d_2 = d_1 - \sigma \sqrt{t}$$

6. Interest Rate Options:

$$C_0 = \frac{AP}{e^{r(N \times \frac{30}{360})}} [FRA (M*N) N(d_1) - XN(d_2)] \times NP$$

$$\text{Where: } AP = \text{Accrual Period} = \frac{\text{Actual}}{365} = \left[\frac{(N-M) \times 30}{360} \right]$$

NP = Notional Principal on the FRA.

7. Swaptions:

$$V_{\text{payer swaption}} = PVA [SFR. N(d_1) - XN(d_2)] \times NP \times AP$$

$$8. \Delta C = \text{Call Delta} \times \Delta s + \frac{1}{2} \text{Gamma} \times \Delta s^2$$

$$9. \Delta P = \text{Put Delta} \times \Delta s + \frac{1}{2} \text{Gamma} \times \Delta s^2$$

Alternative Investments

Real Estate Investment

1. Income Approach

Net Operating Income:

Rental income (if fully occupied)

+ other income

= Potential gross income

- vacancy and collection loss

= Effective gross income

- Operating expense

= Net operating income

The Capitalization Rate:

$$1. \text{ Cap Rate} = \frac{\text{NOI}}{\text{Value}}$$

$$\text{or, Value} = V_0 = \frac{\text{NOI}}{\text{Cap.Rate}}$$

$$\text{or, Cap Rate} = \frac{\text{NOI}}{\text{Comparable Sales Price}}$$

$$P_0 = \frac{D_1}{R_e - g}$$

$$\text{or, } P_0 = \frac{\text{NOI}}{\text{Cap.Rate}}$$

$$\text{or, Cap Rate} = \frac{\text{NOI}}{P_0}$$

↓
Value of property today

$$2. \text{ Value} = \frac{\text{Rent}}{\text{ARY}}$$

$$\text{or, ARY} = \frac{\text{Rent}}{\text{Comparable Sale } P_x}$$

$$3. \text{ Gross Income Multiplier} = \frac{\text{Sales Price}}{\text{Gross Income}}$$

$$4. \text{ Value} = \text{Gross Income} \times \text{Gross Income Multiplier}$$

Discounted Cash Flow Method:

$$1. \text{ Cap Rate} = \text{Discounted Rate} - \text{Growth Rate} = R_e - g$$

$$2. \text{ Discounted Rate} = \text{Cap Rate} + \text{Growth Rate}$$

$$3. \text{ Value} = V_0 = \frac{\text{NOI}}{(r-g)} = \frac{\text{NOI}}{\text{Cap Rate}}$$

2. COST APPROACH

$V_{\text{property}} = (\text{Replacement cost} - \text{Cost of fixing curable items}) - \text{Depreciation} - \text{Incurable expense}$
capitalised + Market value of land

Where Depreciation = $\frac{\text{Effective Age}}{\text{Economic Life}} \times [\text{Replacement Cost} - \text{Curable Items}]$

3. Appraisal-Based indices:

$$a) \text{ Return} = \frac{\text{NOI} - \text{Capital Expenditure} + \text{End Market Value} - \text{Beginning Market Value}}{\text{Beginning Market Value}}$$

4. Ratios to consider for evaluation

$$a) \text{ Debt Service Coverage Ratio} = \frac{\text{First year NOI}}{\text{Debt Service}} \quad [\text{higher the better}]$$

$$b) \text{ Loan-to - Value Ratio} = \frac{\text{Loan Amt}}{\text{Appraisal Value}} \quad [\text{lower the better}]$$

$$c) \text{ Equity Dividend Rate} = \frac{\text{First year CF}}{\text{Equity}}$$

$$5. \text{ Valuation After Renovation} = \frac{\text{Stabilised NOI}}{\text{Cap.Rate}}$$

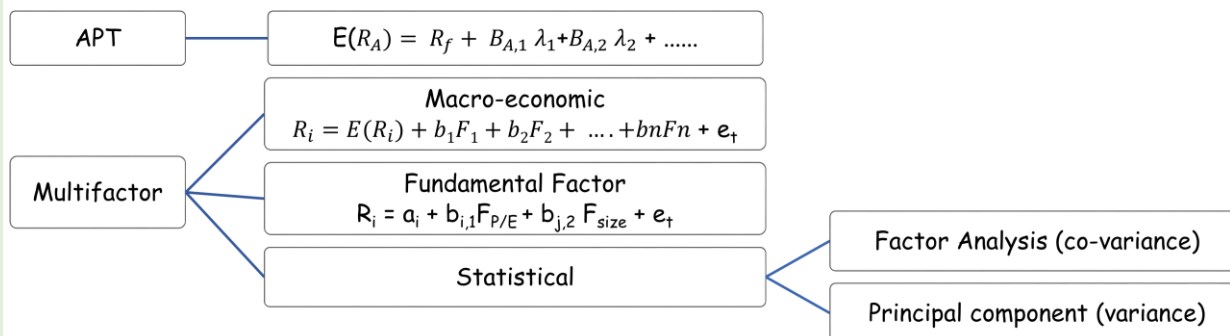

$$6. \text{ Valuation After Renovation} - \text{PV of loss} = \text{Total Value}$$

Introduction to Commodities and Commodity Derivatives

1. Total Return = Collateral Return (HPY on T-bill) + Price Return $\left(\frac{P_1 - P_0}{P_0}\right)$ + Roll Return
2. Price Return = $\frac{\text{Current Price} - \text{Previous Price}}{\text{Previous Price}}$
3. Roll Return = $\frac{\text{Price of Expiring Futures Contract} - \text{Price of New Futures Contract}}{\text{Price of Expiring Futures Contract}}$

Portfolio Management

Using Multifactor Models

1. Standardized P/E Sensitivity:

$$b_{i1} = \frac{\left(\frac{P}{E}\right)_i - \bar{P/E}}{\sigma_{P/E}}$$

2. Active Return = $(R_p) - (R_B)$

$$\text{Active Risk} = \sigma_{(R_p - R_B)}$$

3. IR = $\frac{\bar{R}_p - \bar{R}_B}{\sigma_{(R_p - R_B)}}$

4. Return Attribution: Active Return = Factor Return + Security Selection Return

5. Factor Return =

$$\sum_{i=1}^k (\beta_{Pi} - \beta_{bi}) \times \lambda_i$$

6. Active Specific Risk =

$$\sum_{i=1}^n (W_{Pi} - W_{bi})^2 \times \sigma_{ei}^2$$

7. Carhart Model-

$$E(R) = R_F + \beta_1 \text{RMRF} + \beta_2 \text{SMB} + \beta_3 \text{HML} + \beta_4 \text{WML}$$

Measuring and Managing Market Risk

1. $\sigma_{\text{Portfolio}}^2 = W_A^2 \sigma_A^2 + W_B^2 \sigma_B^2 + 2W_A W_B \text{COV}_{AB}$
2. $E(R_i) = R_f + \beta_{i1} [E(\text{RMKT}) - R_f]$
3. Change in Price = - Duration $(\Delta Y) + \frac{1}{2}$ Convexity $(\Delta Y)^2$
4. Change in Call Price = delta $(\Delta S) + \frac{1}{2}$ gamma $(\Delta S)^2 + \text{vega} (\Delta V)$
5. Discount Rate = $R + \pi + \theta + \gamma + K + \emptyset$
6. Inter-temporal Rate of Substitution = $\frac{U_t}{U_0} = \frac{\text{Future}}{\text{Current}}$
7. $PO = E(mt)$
8. Real Risk-free rate of Return:

$$R = \frac{1 - P_0}{P_0} = \left(\frac{1}{E(m_t)} \right) - 1$$
9. $P_0 = \frac{E(P_1)}{1+R} + \text{cov}(P_1, M_1)$
 P_0 is lower; Return \uparrow (Since Risk Taken)
 $\frac{E(P_1)}{1+R}$ When no risk = P_0
10. Disc. Rate = $R + \pi$ (short term)
 $R + \pi + \theta$ (long-term)
11. Taylor Rule: $r = R_n + \pi + 0.5 (\pi - \pi^*) + 0.5 (y - y^*)$
12. BEI = Yield on Non-Inflation Indexed Bond - Yield on Non-Inflation Indexed Bond
13. BEI = $\pi + \theta$

Analysis of Active Portfolio Management

1. Active Return $E(R_A) = E(R_P) - E(R_B)$
2. For an Active Portfolio of N Securities:

$$E(R_A) = \sum \Delta w_i E(R_i)$$
3. Weighted Average of Securities Returns:

$$E(R_P) = \sum w_{P,i} E(R_{P,i}) \text{ and } E(R_B) = \sum w_{B,i} E(R_{B,i})$$
4. Ex - ante Active Return:

$$E(R_A) = \sum w_{P,i} E(R_{P,i}) - \sum w_{B,i} E(R_{B,i})$$
5. Security Selection Return:

$$E(R_A) = \sum \Delta w_i E(R_{B,i}) + \sum w_{P,i} E(R_{A,i})$$
6. Sharpe Ratio = $\frac{R_P - R_F}{\sigma_P}$
7. IR = $\frac{R_P - R_B}{\sigma_{(R_P - R_B)}}$
8. With Optimal Level of Active Risk:

$$SR_P = \sqrt{SR_B^2 + IR^2}$$

Total Risk of The Portfolio: $\sigma_P^2 = \sigma_B^2 + \sigma_A^2$
9. Unconstrained:

$$IR^* = IC \times \sqrt{BR}$$

$$E(R_A)^* = IC \sqrt{BR} \sigma_A$$
10. Constrained:

$$IR = IC \times \sqrt{BR} \times TC$$

$$E(R_A) = IC \times \sqrt{BR} \times TC \times \sigma_A$$

$$SR_{pc} = \sqrt{SR_B^2 + (IR^2 \times TC)}$$
11. $\sigma_{CA} = \frac{TC \cdot IR^*}{SR_B} \times \sigma_B$
12. Ex-post Performance Measurement:

$$E(R_A | IC_R) = TC \times IC_R \times \sqrt{BR} \sigma_A$$

$$R_A = E(R_A | IC_R) + \text{noise}$$
13. The Expected Active Return for A Given Target Level of Active Risk: $E(R_A) = IR \times \sigma_A$
14. $IC = 2(\% \text{ correct}) - 1$
15. $\sigma_c = [\sigma_x^2 + \sigma_y^2 - 2 \sigma_x \sigma_y r_{x,y}]^{1/2}$
16. Annualized Active Risk: $\sigma_A = \sigma_c \times \sqrt{BR}$
 Annualized Active Return: $E(R_A) = IC \sqrt{BR} \times \sigma_A$
17. $BR = \frac{N}{1 + (N-1)r}$
